NOTORITE

Product one-pager · Data-driven product reputation and decision support

Product thesis
Help people compare products using structured evidence rather than relying on isolated ratings or potentially misleading review summaries.

PROBLEM

Product reviews are fragmented across sellers and platforms. Raw review counts and star averages can hide differences in evidence quality, recurring issues, and the reliability of a product's reputation.

TARGET USERS

People comparing products before purchase, and users who need a concise, evidence-based view of product strengths, risks, and recurring customer themes.

SOLUTION

Notorite collects and processes product-related information, organizes evidence into a consistent product view, and presents a structured reputation assessment with comparisons and explainable risk signals. AI can help extract sentiment and recurring themes; deterministic rules govern the final score and decision logic.

CORE PRODUCT PRINCIPLES

- **Evidence before claims:** distinguish observed data from conclusions.
- **Deterministic scoring:** the score is produced by explicit rules, not generated freely by an LLM.
- **Handle insufficient evidence honestly:** when the minimum evidence threshold is not met, do not present a reputation score or grade.
- **Separate responsibilities:** data intake and product presentation are distinct from analysis and scoring.

MVP SCOPE

- **Included:** product data collection and processing; product-level reputation view; comparison pages; recurring themes and risk signals; rule-based scoring; structured outputs for user decisions.
- **Excluded:** unsupported claims of certainty, unvalidated predictive claims, and allowing an LLM to invent or directly determine the final reputation score.

SUCCESS MEASUREMENT

Proposed measures to instrument and validate: product-comparison completion rate; click-through from analysis to a product detail or retailer; repeat usage; coverage of products with sufficient evidence; and user-reported usefulness. These are proposed metrics, not claimed results.

KEY PRODUCT TRADE-OFF

Prefer an explicit "insufficient evidence" state over a confident-looking score built on too little data. This reduces apparent coverage but protects trust and makes the product's limits visible.

Sanitized portfolio summary. No customer-confidential data, credentials, internal infrastructure details, or private commercial information included.
